My Sojourn as an Application Developer

My passion for technology started at very tender age, you know how amazing it is when you see planes flying in the sky, a radio set talking, computers controlling satellites and other wonderful stuffs, these pushed me to studying engineering and after a few research, I discovered that combining engineering and software development will always leads to developing an amazing product or services, so this made me launch a career in software development.

Choosing this career path hasn't failed me in any way because of so many reasons that comes with it.

Firstly, it helps in solving real world problems thereby making life easier for people.

Secondly, with my passion for technology, a career in software development allows me to work on something I love doing and it has been fun doing it.

Thirdly, a career in tech has help in continuous learning which in turn help me to stay updated about new tech trends.

Being a good developer to me is not just writing codes that work, but also following a standard guidelines, principles and best practice which at end will give me well-structured and documented code. Some of these guidelines are test-driven development, following a specific language coding standard, using continuous integration development process, documenting functionalities of the code, etc.

I have been working with LAMP stack technology and Laravel for some years now. Laravel aids in developing nice and elegant software and also speed up development time. Laravel powers 70% of my previous projects and it's been awesome working with it.

Finally, I try my best every day to make sure I learn new technologies to help improve my skills and expertise in my career path.
